Download ide to work. Q: How to get scroll position of an element in a div? I have a div.data with height: 200px; I want to get the scroll position of this div when the user scroll to the bottom of the.data element. How can I do that with jquery? A: You could just do this: `var scroll = $("#div").scrollTop();` EDIT I didn't notice you were looking at the contents of #div, not its own position. Here's how to do it with the text of the element. `var $myElement = $("#id");` `var scroll = $myElement.scrollTop();` A: Very specific. However, I would rather advice you to use e.g. jquery-sparklines library that does a lot of stuff with bower you can find here The supported browsers are Chrome, Safari, Firefox and IE 8+. Simulators

An emulator/simulator is an application that creates a virtual computer system that executes programs written for a certain type of platform, in this case, hardware. The execution of this virtual machine is achieved with the aid of a program called a simulator, and the entire process is accomplished as if the emulator were running natively on the computer. All common tasks which may occur when running the operating system on a physical device (such as disk drive initialization) are also performed by the emulator. This process allows developers to test their software on completely different

hardware (other than their own) with zero maintenance and no cost. Linux is the most frequently used operating system on which emulators are available for all kinds of platforms: x86, x86-64, ARM, PowerPC, MIPS and the
